

GridWise — 2:40 Demo Script

The problem and our solution in the first thirty seconds, ten seconds on what the language model actually does, the three most important test cases in the next eighty seconds, then error handling and the close. Every beat tells you what to do on screen, exactly what to say, and how to say it.

Live URL	https://brian-sheffield-surely-fly.trycloudflare.com
Repository	https://github.com/meherabmehu/GridWise-LLM-Energy-Optimizer
Structure	0:00 intro · 0:30 the model · 0:40 three cases · 2:00 robustness · 2:25 close

Before you press record

- Tunnel window open, laptop on the charger, sleep disabled.
- Tab one: <https://brian-sheffield-surely-fly.trycloudflare.com/health>. Tab two: <https://brian-sheffield-surely-fly.trycloudflare.com/docs>.
- Chrome zoom 110 to 125 percent, notifications off, record in full screen (F11).
- Keep the **Test Cases** file open beside you — that is where you copy CASE 1, 2 and 3 from.

The script

PART 1 — INTRO

0:00 – 0:15 The problem, in four lines

On screen Start on the /health page

SAY: “This is GridWise. A campus needs the cheapest possible plan for the next twenty-four hours of electricity. Every hour has a demand, some solar, and a price, and there is one battery. The instructions arrive as a few sentences written in plain English.”

Do Do not scroll. Speak calmly.

Tip Keep this short. You have only thirty seconds for the whole introduction.

0:15 – 0:30 Our solution, in four lines

On screen Still on the health page

SAY: “Our solution has three parts. A real language model reads the notes and returns only structured directives — it never does the maths. Guardrails then check that output, so it cannot change the data. And a solver builds the cheapest valid plan, which a validator checks before we reply.”

Do No mouse movement. This is the only technical sentence in the video.

Tip Say “it never does the maths” slowly. That is the line judges listen for.

PART 1 — THE MODEL

0:30 – 0:40 What the language model actually does

On screen Whatever is on screen — do not move the mouse

SAY: “So what does the language model actually do? It turns a sentence into structure: which rule, which hours, which value. Nothing else — the maths stays with the solver.”

Do Hold still. Ten seconds, no clicks.

Tip This beat exists because judges specifically ask “what is the model doing?” Answer it before they ask.

PART 2 — CASE 1

0:40 – 1:05 Official case one: two notes, one of them unrelated

On screen /docs → POST /optimize-energy → Try it out → paste CASE 1 → Execute

SAY: “First case, an official sample. The panels are washed from noon to two PM, so usable solar drops to twenty-five percent. The second note is about a registration deadline — nothing to do with energy. Solar reduction, factor zero point two five, hours twelve and thirteen — and the unrelated note becomes no-op. Total cost: thirty-eight thousand three hundred sixty-five, the official optimum.”

Do Paste, Execute, wait one second, then rest the mouse on the total cost.

Tip **The no-op is the point.** Say it clearly — the model did not invent a rule.

PART 2 — CASE 2

1:05 – 1:30 Official case two: a limit on grid import

On screen Same page → paste CASE 2 → Execute

SAY: “Second case, also official. Grid import is capped at one hundred fifty-five kilowatt-hours between six and nine in the evening. The interpreter gives hours eighteen, nineteen and twenty — the start hour counts, the end hour does not, which is the rule in the official data. The plan costs thirty-three thousand nine hundred fifty: the official optimum again.”

Do Point at the hours list, then at the total cost.

Tip Saying “the end hour does not count” shows you read the official rule.

PART 2 — CASE 3

1:30 – 2:00 Case three: our language test — the most important one

On screen Same page → paste CASE 3 → Execute

SAY: “Third case is the language test. Two sentences, and only the second one matters — the first is about the canteen. In casual words it asks us to be gentle on the grid between six and ten PM, under one hundred fifty kWh an hour. The model ignored the canteen and returned a grid cap: hours eighteen to twenty-one, limit one hundred fifty. Same meaning, new words — that is understanding, not keyword matching.”

Do Let the response sit on screen for a beat before the last sentence.

Tip **This is the highest-value moment of the video.** Slow down and give it your clearest voice.

PART 3 — ROBUSTNESS

2:00 – 2:25 Bad input, and two more notes that also work

On screen Type /no-such-path, then /optimize-energy in the address bar

SAY: “Bad input never breaks it: a wrong path gives four-oh-four, a GET on the POST endpoint gives four-oh-five, a broken body gives four hundred with a clean message — no crash, no API key. Two more notes work as well: an unrelated one becomes no-op, and a negation — charging is fine, but do not top up between four and seven — becomes a no-charge window for hours four, five and six.”

Do Show the two error pages briefly — two seconds each. Do not read the JSON aloud.

Tip Speak the codes as words: “four-oh-four”. It sounds natural and is easy to follow.

PART 3 — CLOSE

2:25 – 2:40 Close

On screen Back on the /health page

SAY: “All ten official cases match the published optimum, and a response comes back in under two seconds. Same code locally, in Docker, and on this public link. Thank you.”

Do Stop moving the mouse. Say the last two sentences slowly, then stop recording.

Tip Do not add anything after “thank you”.

Delivery notes

- Pause briefly at the end of every sentence, especially after a number.
- Wait **one second** after each Execute so the result is visible on camera.
- Never click Execute twice — wait for it, even when the model call is slow.
- Say numbers as words: “thirty-eight thousand three hundred sixty-five”.

The three cases shown in the video

CASE 1

SHOW IN VIDEO

Official sample SAMPLE-01 — solar reduction, plus a note to ignore

The model reads two notes at once and returns no-op for the unrelated one.

Expected: solar_reduction (hours [12, 13], factor 0.25) then no_op (applies false)

Totals: 2692.50 kWh / 38365.00 BDT / peak 175.00 kWh

official optimum for this case: 2692.50 / 38365.00 / 175

CASE 2

SHOW IN VIDEO

Official sample SAMPLE-05 — grid import capped from 6 PM to 9 PM

A window directive: the start hour counts, the end hour does not.

Expected: max_grid_window (hours [18, 19, 20], max_grid_kwh 155.0)

Totals: 2430.00 kWh / 33950.00 BDT / peak 175.00 kWh

official optimum for this case: 2430.00 / 33950.00 / 175

CASE 3

SHOW IN VIDEO

Language test — a distractor sentence, then a casually worded grid limit

The model keeps the real instruction, ignores the canteen sentence, and extracts the window and the limit from casual wording. A keyword matcher fails here.

Expected: max_grid_window (hours [18, 19, 20, 21], max_grid_kwh 150.0)

Totals: 2430.00 kWh / 33950.00 BDT / peak 175.00 kWh

CASE 4

EXTRA

Unrelated note — must produce no_op

No invented rule when a note has nothing to do with energy.

Expected: no_op (applies false, structured_adjustment null)

Totals: 2430.00 kWh / 33950.00 BDT / peak 175.00 kWh

CASE 5

EXTRA

Language test — negation: night charging is fine, no top-up 4 AM to 7 AM

The model handles negation: it allows overnight charging and blocks only the stated window, instead of blocking charging entirely.

Expected: no_charge_window (hours [4, 5, 6])

Totals: 2430.00 kWh / 34010.00 BDT / peak 175.00 kWh

Error steps for the last thirty seconds

What to do	Expected
Open https://brian-sheffield-surely-fly.trycloudflare.com/no-such-path	404 {"detail":"Not Found"}
Open https://brian-sheffield-surely-fly.trycloudflare.com/optimize-energy	405 {"detail":"Method Not Allowed"}
/docs -> POST /optimize-energy -> Try it out -> paste the word boom -> Execute	400 {"error":{"type":"malformed_json","message":"request body is not valid JSON"}}

Timing. The narration is about four hundred words, which is 2:40 at a calm pace. Do not rush. Speaking a little less is fine; speaking too fast loses the judge completely.
